A Molecule tracerences: UNINPROT: P01478
C COmment: In this species, the venom of the male is lethal rather than that of the fema
C COMMENT: Four disulfide bonds are present.
C Superfamily: robustoxin
C Keywords: neurotoxin; venom
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          갋
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          robustoxin - funnel-web spider (Atrax robustus)

"Inhibition of single Shaker K channels by kappa-conotoxin-PVIIA.";
Biophys. J. 82:3003-3011(2002).

Biophys. J. 82:3003-3011(2002).

-I-FUNCTION: Kappa-conotoxins bind and inhibit voltage-sensitive potassium channels. The rat brain voltage-gated potassium channel protein Shaker (Drosophila) is sensitive. The protein Kv1.1 is resistant to this toxin, but the voltage-gated potassium channel protein Shaker (Drosophila) is sensitive. The interaction site between the Shaker channel and this toxin is within the S5-S6 loop of the Shaker channel. In fish, this toxin is induces hyperactivity, followed by continuous contraction and extension of major fins, without immobilization or death.

Injection of this peptide together with the delta-conocoxin pvIA causes the sudden tetanus of prey (STOP) syndrome, which is a single, lethal "fin-pop" in envenomated fish. In mice, induces

TISSUE SPECIFICITY: Expressed by the venom duct.
MASS SPECIFICITY: NM=3268.4; METHOD=FAB; RANGE=46-72; NOTE=Ref.1.
SIMILARITY: Belongs to the conotoxin O-superfamily. Kappa-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CAUTION: Because analogs resulting of mutagenesis of Hyp-49, Asn-50, Leu-57 and Asp-59 gave very low yields upon folding, the results of mutagenesis on these residues should be interpreted
                                                                                                                                                                                                                                                                         s.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MEDLINE=99329121; PubMed=10398696;

                                                           Nielean K.J., Thomas L., Lewis R.J., Alewood P.P., Craik D.J.,
"A consensus structure for omega-conotoxins with different
selectivities for voltage-sensitive calcium channel subtypes:
comparison of MVIA, SVIB and SNX-202.";
J. Mol. Biol. 263:297-310(1996).
-!- FUNCTION: Omega-conotoxins act thresynaptic membranes, they bind
and block voltage-sensitive calcium channels (VSCC). This toxin
blocks N-, P-, and Q-type calcium channels.
-!- SUBCELBLUAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed by the venom duct.
-!- SIMILARITY: Belongs to the conotoxin O-superfamily. Omega-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

-!- FUNCTION: Omega-conotoxins act at presynaptic membranes, they bind and block voltage-sensitive calcium channels (VSCC) (By similarity). This toxin blocks N-, P-, and Q-type calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Kintner C.;
Submitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.

Submitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.

SUBCELLULAR LOCATION: Type I membrane protein.

SUBCELLULAR LOCATION: Type I membrane protein.

SIMILARITY: Belongs to the NOTCH family.

SIMILARITY: Contains 6 ANK repeats.

SIMILARITY: Contains 36 EGF-like domains.

SIMILARITY: Contains 3 EGF-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                            HSSP; P05484; 1DW4.

Amidation: Calcium channel inhibitor; Direct protein sequencing; Ionic channel inhibitor; Neurotoxin; Presynaptic neurotoxin; Toxin. Ionic channel inhibitor; Neurotoxin; Presynaptic neurotoxin; Toxin. DISULFID 8 20 By similarity.

MOD_RES 26 26 Cysteine amide.

SEQUENCE 26 AA; 2790 MW; 56EFC382335C4A8B CRC64;
                                                                                                                -!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUB SPECIFICITY: Expressed by the venom duct.
-!- SIMILARITY: Belongs to the conotoxin O-superfamily. Omega-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Xenopus laevis (African clawed frog).

S.-C., Choi K.-W.;

Interaction of Par-6 and Crumbs complexes is essential for

photoreceptor morphogenesis in Drosophila.";

Development 130:4363-4372 (2003).

-I FUNCTION: Plays a central role in cell polarity establishment.

Participates in the assembly, positioning and maintenance of
adherens junctions via its interaction with the SAC complex.

Controls the coalescence of the spots of zonula adherens (ZA) into
a adhesive ring around the cells. It may act as a signal. Involved
in morphogenesis of the photoreceptor rhabdomere, for positioning
attd growth of rhabdomere and AJ during the crucial period of
photoreceptor extension along the proximodistal axis of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       INTERACTION WITH PATJ.

(Potential).
(Potential).
composed of par-6, baz and aPKC, via its interaction with Patj.
Interacts with other proteins with Patj and sdt via its short
cytoplasmic tail.
-!- SUBCELLULAR LOCATION: Type I membrane protein. Specifically
localized to the apical membrane.
-!- PTM: Phosphorylated in the cytoplasmic domain (Potential).
-!- SIMILARITY: Contains 29 EGF-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Crumbs protein.

Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). May play an essential role in postimplantation development, probably in some aspect of cell specification and/or differentiation. May be involved in mesoderm development, somite formation on mercentian envolved in the maturation of both CD4+ and CD8+ cells in the thymus. Important for follicular differentiation and possibly cell fate selection
                                                                                                                                                                [5]

ecroacan, eye and developing whisker ionizing matrix cells expression starts as different cell types become distinguishable in the developing follicle. Expression persists throughout the growth phase of the follicle and maintenins the same expression profile in the second hair cycle. The cells in the follicle that undergo a phase of high level expression are in transition from mitotic precursors to several discreet, differentiating cell types.

-IP TM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane.
                                                                                                                                                                                                                                 Note-No experimental confirmation available;
Note-No experimental confirmation available;
TISSUE SPECIFICITY: Highly expressed in the brain, lung and trymus. Expressed at lower levels in the spienn, bone-marrow, spinal cord, eyes, mammary gland, liver, intestine, skeletal muscle, kidney and heart. In the hair follicle, highly expressed ecclusively in the epithelial compartment.

DEVELOPMENTAL STAGE: First detected in the mesoderm at 7.5 dpc By 8.5 dpc highly expressed in presomitic mesoderm, mesenchyme and endothelial cells, while much lower levels are seen in the neuroepithelium. Between 9.5-10.5 dpc expressed at high levels in the neuroepithelium. At 13.5 dpc expressed at high levels in the cetoderm, eye and developing whisker follicles. Hair follicle
                  terminal fragment N(EC) which are probably linked by disulfide bonds. Interacts with DTX1 and DTX2.
SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus.
                                                                                                                                                                                                                      VSP 001403, VSP 001404;
    SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by Aimiles
                                                                                                                                          Event=Alternative splicing; Named isoforms=2;

J. Comp. Neurol. 436:167-181(2001).

-!- FUNCTION: Punctions as a receptor for membrane-bound ligands
Jagged1, Jagged2 and Deltal to regulate cell-fate determination.
Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs. May play an essential role in postimplantation development, probably in some aspect of cell specification and/or cell fragment, probably in some aspect of cell specification and/or cell-subjurial fragment N(EC) which are probably linked by disulfide terminal fragment N(EC) which are probably linked by disulfide proteclytical processing NICD is translocated to the nucleus.

-!- SUBCELLULAR LOCATION: Type I membrane protein. Following proteclytical processing NICD is translocated to the nucleus.

-!- TISSUE SPECIFICITY: Highly expressed in postnatal life, within numerous cells throughout the CNS. It is more highly localized to ventral nervous system colls throughout the CNS. It is more highly localized to be sent and choroid the colls throughout the CNS. It is more highly localized to be sent and collised to

PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a Cterminal fragment N(TM) and a N-terminal fragment N(EC). Following
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rattus norvegicus (Rat).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      via its ANK repeats.
SUBCELLULAR LOCATION: Type I membrane protein. Upon activation and the cell membrane and enters into the nucleus in conjunction with Su(H).
FIN: Upon binding its ligands such as Delta or Serrate, it is cleaved (S2 cleavage) in its extracellular domain, close to the transmembrane domain. S2 cleavage is probably mediated by Kuz. It is then cleaved (S3 cleavage) downstream of its transmembrane domain, releasing it from the cell membrane. S3 cleavage requires

Mizutani T., Taniguchi Y., Aoki T., Hashimoto N., Honjo T.;

T. Conservation of the biochemical mechanisms of signal transduction among mammalian Notch family members.";

Proc. Natl. Acad. Sci. U.S.A. 98:9026-9031(2001).

-!- FUNCTION: FUNCTIONS as a receptor for membrane-bound ligands of the proc. Natl. Acad. Sci. U.S.A. 98:9026-9031(2001).

-!- FUNCTION: FUNCTIONS and Deltal to regulate cell-fate determination. Upon 19gand activation through the released notch intracellular companial (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). May regulate branching morphogenesis in the developing vascular system.

-!- SUBDNIT: Heterodimer of a C-terminal fragment N(EC) which are probably linked by disulfide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DEVELOPMENTAL STAGE: Highly expressed in endothelial cells during embryonic development from 9.0 dpc.

FTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PTM: Phosphorylated.

DISFASE: Loss of the extracellular domain causes constitutive activation of the Notch protein, which leads to hyperproliferation of glandular epithelial tissues and development of mammary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus. TISSUE SPECIFICITY: Highly expressed in lung, moderately in heart kidney, and at lower levels in the ovary and skeletal muscle. A very low expression is seen in the brain, intestine, liver and

```

-!- SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus.
-!- TRSUE SPECIFICITY: Proliferating neuroepithelium.
-!- DEVELOPMENTAL STAGE: CNS development.
-!- PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-

SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide

```

Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@lsb-sib.ch).
terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived poptide containing the intracellular domain (NICD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Neurogenic locus notch homolog protein 3.
Notch extracellular truncation.

-!- FTM: Phosphorylated.
-! SIMILARITY: Belongs to the NOTCH family.
-!- SIMILARITY: Contains 5 ANK repeats.
-!- SIMILARITY: Contains 34 EGF-like domains.
-!- SIMILARITY: Contains 3 Lin/Notch repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cytoplasmic.

suppression.

-!SUBUNIT: Hetercodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide bonds (By similarity).

-!SUBCENTIVAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus.

-!TISSUE SPECIFICITY: Expressed in postnatal life, within numerous cells throughout the CNS. It is more highly localized to ventricular germinal zones and, in early postnatal life, within numerous cells throughout the CNS. It is more highly localized to ventricular germinal zones.

-!PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertage in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNN-alpha converting enzyme trans-converting enzyme trans-converting membrane-associated intermediate fragment called converting enzyme trans-converting membrane-associated intermediate fragment called converting enzyme trans-converting membrane associated intermediate fragment called converting enzyme trans-converting membrane associated intermediate fragment called converting enzyme trans-converting membrane called converting enzyme trans-converting membrane called converting enzyme called called membrane associated intermediate fragment called called called membrane associated intermediate fragment called called called membrane associated intermediate fragment called called membrane associated intermediate fragment called called called membrane associated intermediate fragment called cal

notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).

PTM: Phosphorylated (By similarity).

SIMILARITY: Belongs to the NOTCH family.

SIMILARITY: Contains 5 ANK repeats.

SIMILARITY: Contains 34 EGF-like domains.

SIMILARITY: Contains 3 Lin/Notch repeats.
